

User documentation

This documentation will guide you through the proper use of the application. Read this file thoroughly.

Functionality:

- showing the current weather data in any city across the globe;
- showing the current temperature;
- showing the current humidity;
- showing the current brief description;
- showing the emoji describing the weather.

Description:

 Users of this application can make requests typing any city across the globe to find out the current weather.

 The application has a form to type a city. Pick your city or any others. Hit the button to make a request. Note that empty requests will lead to an error message. All extra spaces are ignored. If data is not fetched, the corresponding error message will pop up. If you accidentally reload the application or leave its page, the warning will be shown to prevent data loss.

This application is already deployed and available to use via the link: <https://sleeplessglory.github.io/weather-api>
